DETAILED ACTION

Claim Rejections - 35 USC § 112

- 1. The following is a quotation of the second paragraph of 35 U.S.C. 112:
 - The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.
- 2. Claim 13 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
- 3. The term "high" in claim 13 is a relative term which renders the claim indefinite.

 The term "high" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention.

Claim Rejections - 35 USC § 103

- 4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Page 2

5. Claims 1-2 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kenyon et al. (U.S. Patent No. 6,423,437 B1) and further in view of Lee et al. (U.S. Pub. No. 2003/0219635 A1).

With respect to claims 1 and 6, Kenyon et al. disclose a passive air breathing fuel cell wherein the polymer electrolyte fuel cell of the present invention includes a plurality of fuel cell units arranged along a common central axis in a stack. The fuel cell units may be formed in a conventional manner, and each includes a polymer electrolyte membrane. The stacked fuel cell units have an inner periphery defining a fuel flow channel through which fuel can flow in an axial direction. An electrically conductive current collector is electrically connected to an anode of a fuel cell unit at one end of the stack and an electrically conductive current collector is electrically connected to the cathode of a fuel cell unit at another end of the stack. A fuel supply inlet is positioned at one end of the stack to direct fuel therethrough to the flow channel (Col 2 lines 15-30). This type of passive fuel cell has a stack of fuel cell units 11 which are held together in the stack by end plates 12 and 13. A bolt 15 extends through a central fuel supply channel 16, and nuts 17 and 18 are threaded onto the ends of the bolt 15 into engagement with the end plates 12 and 13, respectively, to press on the end plates, thereby compressing the stack of fuel cell units 11 and holding the stack together. An upper current collector plate 20 is mounted in the stack between the end plate 12 and the uppermost fuel cell unit 11 in the stack, and a bottom current collector plate 21 is mounted between the bottom end plate 13 and the lowest fuel cell unit 11 in the stack (Col 3 lines 45-67). As also shown in the more detailed view of FIG. 3, the bottom nut

48 is threaded onto the threaded bottom end 70 of the bolt 46 into engagement with the end plate 44, with an O-ring 71 seated in a groove in the nut 48 to provide an airtight seal between the end plate 44 and the nut 48 (Col 6 lines 45-55). If desired, a center manifold 75 may be mounted within the fuel flow channel 35 around the bolt 46 to distribute fuel and to help distribute moisture evenly through the length of the flow channel 35 (Col 7 lines 1-15).

With respect to an outer periphery of the grooves being opened to an outer periphery of the porous oxygen passage plate and not extending to an therefore being closed to the central bore, Kenyon et al. teach that each of the diffusion cell units 39 includes a moisture permeable membrane 55, a first upper layer of diffuser material 56 "oxygen passage plate" second upper layer of diffuser material 57 "oxygen passage plate" above the layer 56, and a lower layer of diffuser material 58 on the side of the membrane 55 opposite to the side at which the diffuser material layers 56 and 57 are located. An inner ring gasket 60 engages with the membrane 55 to seal off the inner periphery of the diffusion cell unit from the flow channel 35 "seals off oxygen plate from central bore" except at the exposed inner periphery of the lower diffuser layer 58 "fuel passage plate". A ring shaped outer gasket 61 is engaged with the membrane 55 at the outer periphery of the diffusion cell unit and seals off the bottom diffuser layer 58 from the outside air (Col 5 lines 34-67).

Kenyon et al. do not specifically teach wherein the oxygen passage plate comprises a plurality of opened grooves on a surface thereof opposed to the oxygen electrode, and the grooves are opened outside at both ends thereof. However Lee et

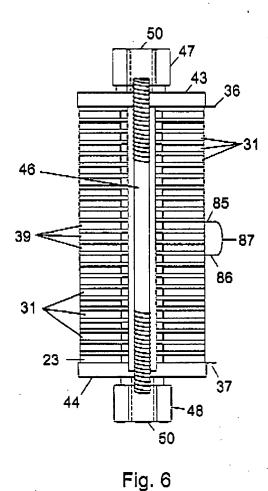

Application/Control Number: 10/649,869

Art Unit: 1745

al. discloses a cooling system for a fuel cell stack wherein the electrically conductive plates sandwiching the MEAs may contain an array of grooves in the faces thereof that define a reactant flow field for distributing the fuel cell's gaseous reactants (i.e., hydrogen and oxygen in the form of air) over the surfaces of the respective cathode and anode. These reactant flow fields generally include a plurality of lands that define a plurality of flow channels therebetween through which the gaseous reactants flow from a supply header at one end of the flow channels to an exhaust header at the opposite end of the flow channels (Paragraph 0004). Therefore it would have been obvious to one of ordinary skill in the art to incorporate grooves in the faces of the plates of Lee et al. into the fuel cell of Kenyon et al. because Lee et al teach that the MEAs may contain an array of grooves in the faces thereof that define a reactant flow field for distributing the fuel cell's gaseous reactants (i.e., hydrogen and oxygen in the form of air) over the surfaces of the respective cathode and anode. (Paragraph 0004).

Page 5

With respect to claim 5, Kenyon et al disclose a passive air breathing fuel cell wherein the outer peripheral surface is rectangular in shape see Fig. 6.

6. Claims 2 and 13 are rejected under 35 U.S.C. 103(a) as unpatentable over Kenyon et al. (U.S. Patent No. 6,423,437 B1)

With respect to claims 2 and 13, Kenyon et al. disclose a passive air breathing fuel cell in paragraph 2 above. Kenyon et al. does not specifically teach wherein blowers for blasting an air into the grooves formed on the oxygen passage plates are

provided on the fuel cell to face the grooves. Kenyon et al. also teach that polymer electrolyte fuel cells (also known as proton exchange membrane fuel cells) are well suited to low power applications of the type now typically served by conventional batteries. Such fuel cells are usually designed to use hydrogen gas as the fuel and may be designed to operate with ambient air as the oxidant. Larger fuel cells are often actively humidified, cooled, or supplied with fuel or oxygen under pressure (blower) (It is noted that here Kenyon et al. establishes the fact that the use of pressurized air on fuel cells is well known). However, for fuel cells intended to be used as portable power sources, it is highly desirable that the operation of the fuel cell be passive, with no requirement for forcing either hydrogen fuel or air through the fuel cell (Col 1 lines 10-20). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to use a blower for blasting air into the oxygen passage plates of Kenyon et al. because Kenyon et al. teach that larger fuel cells are often actively humidified, cooled, or supplied with fuel or oxygen under pressure (blower).

7. Claims 2 and 13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kenyon et al. (U.S. Patent No. 6,423,437 B1) as applied to claim 1 above in view of Reiser (U.S. Patent No. 6,497,971 B1).

With respect to claims 2 and 13, Kenyon et al. disclose a passive air breathing fuel cell in paragraph 2 above. Kenyon et al. also teach that polymer electrolyte fuel cells (also known as proton exchange membrane fuel cells) are well suited to low power

.

applications of the type now typically served by conventional batteries. Such fuel cells are usually designed to use hydrogen gas as the fuel and may be designed to operate with ambient air as the oxidant. Larger fuel cells are often actively humidified, cooled, or supplied with fuel or oxygen under pressure (blower) (It is noted that here Kenyon et al. establishes the fact that the use of pressurized air on fuel cells is well known). Kenyon et al. does not specifically teach wherein blowers for blasting an air into the grooves formed on the oxygen passage plates are provided on the fuel cell to face the grooves. However Reiser discloses a method and apparatus for improved delivery of input reactants to a fuel cell assembly wherein the fuel cell stack assembly includes a plurality of individual fuel cells each having an electrolyte, cathode and anode, and the cell stack assembly is adapted for defining anode flow fields for exposing the anodes to a fuel, cathode flow fields for exposing the cathodes to an oxidant, and for preventing the commingling of the fuel and oxidant reactants between adjacent anodes and cathodes. Also included are input and output manifolds in fluid communication with the cathode flow fields, and at least one blower mounted with one of the manifolds for flowing oxidant through the cathode flow fields (Col 2 lines 30-45). Therefore it would have been obvious to one of ordinary skill in the art to incorporate the blowers of Reiser into the fuel cell system of Kenyon et al. because Reiser teach that mounting the blowers 17 with the fuel cell apparatus is considered to have several advantages. The blowers can be low power, relatively quiet, and include variable speed motors, such as a variable speed a.c. or d.c. motors, that can be controlled to tailor the flow of oxidant in

accordance with the individual needs of the fuel cell stack assembly 10 (Col 4 lines 21-45).

8. Claims 3 and 4 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kenyon et al. (U.S. Patent No. 6,423,437 B1) in view of Reiser (U.S. Patent No. 6,497,971 B1) as applied to claim 2 above.

With respect to claims 3 and 4, Kenyon et al. as modified by Reiser disclose a passive air breathing fuel cell in paragraph 5 above. Kenyon et al. as modified by Reiser does not specifically teach wherein blowers are arranged in opposition to the both opened ends of the grooves. However, it would have been obvious to one of ordinary skill in the art to incorporate the blowers that are arranged in opposition to the both opened ends of the grooves of the fuel cell of Kenyon et al as modified by Reiser because this fuel cell is circular and the placement of extra blowers to provide air to the oxygen passages on the opposite side would increase the performance of the fuel cell because having blowers on one side only would not adequately supply air to the oxygen passages on the opposite side of this circular fuel cell.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Ben Lewis whose telephone number is 571-272-6481. The examiner can normally be reached on 8:30am - 5:30pm.

Application/Control Number: 10/649,869

Art Unit: 1745

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Patrick Ryan can be reached on 571-272-1292. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
